

MATH 381 HW 1

Christian Jahnel

24 January 2024

1.

- (a) $p \rightarrow q$
- (b) $\neg p \wedge \neg q \wedge r$
- (c) $q \wedge \neg p$

2.

- (a) There are zeros in the decimal expansion of π .
- (b) The number 3 is not positive or the number 4 is not odd (or both).

3.

- hypothesis: if you access the website
- conclusion: you have to register your device or be within the temporary access period
- converse: If you have to register your device or be within the temporary access period, then you access the website.
- inverse: If you do not access the website, then you do not have to register your device nor be within the temporary access period.
- contrapositive: If you do not have to register your device nor be within the temporary access period, then you do not access the website.
- negation: You access the website and you do not have to register your device nor be within the temporary access period.

4. Given that $x \rightarrow y$ is false

(a)

$$x \wedge y$$

$x \rightarrow y$ is only false when x is true and y is false. Since both x and y would need to be true for the conjunction of x and y to be true, it is **false**.

(b)

$$(\neg x) \rightarrow y \equiv \neg(\neg x) \vee y \equiv x \vee y$$

Since this conditional statement can be reduced to the disjunction of x and y , and we know that x must be true and y must be false for $x \rightarrow y$ to be false, only one condition is needed to fulfill the disjunction, and the x is true, so this is **true**.

(c)

$$x \vee \neg y$$

Since we know that x must be true and y must be false for $x \rightarrow y$ to be false, both conditions for this disjunction are fulfilled, so it is **true**.

5.

p	q	r	$p \vee q$	$r \rightarrow p$	$\neg(r \rightarrow p)$	$r \wedge \neg(r \rightarrow p)$	$(p \vee q) \rightarrow (r \wedge \neg(r \rightarrow p))$
